

Fake or Delayed GCash Payment Proof
in Small Online Businesses

Trust the transaction,
not just the screenshot.

CHAPTER

1

INTRODUCTION

THE BURNING PROBLEM

Many student entrepreneurs and small online sellers confirm orders using only customer-submitted GCash screenshots.

When screenshots are fake, cropped, edited, or sent before the payment is actually received, sellers risk **unpaid orders, disputes, and lost trust.**

COMMON RISKS

FAKE OR EDITED SCREENSHOTS

Screenshots can be manipulated to look like successful payments.

DELAYED PAYMENT CONFIRMATION

The buyer may claim payment was sent, but the seller has not received it yet.

WRONG ACCOUNT OR PENDING TRANSFER

Money may be sent to the wrong number, or the transaction may still be processing.

CHAPTER

2

LITERATURE REVIEW

CURRENT SOLUTIONS USED BY SELLERS

CHECK TRANSACTION HISTORY

Sellers review their GCash activity before confirming the order.

VERIFY REFERENCE NUMBER

The reference number is checked to match the payment details.

WAIT FOR APP OR SMS CONFIRMATION

Sellers wait for official notification before releasing the item.

USE QR PAYMENTS

QR codes reduce the risk of sending money to the wrong account.

CONFIRM BEFORE RELEASING ITEM

The product is only released after the seller sees the actual received payment.

KEY INSIGHT

Current solutions exist, but many sellers still rely on screenshots because they are fast and convenient.

CHAPTER

3

METHODOLOGY

PROPOSED STEP-BY-STEP PLAN

VERIFY BEFORE RELEASE

VIEW ACTUAL TRANSACTION HISTORY

Check if the payment appears in the seller's real GCash transaction record.

EXAMINE THE REFERENCE NUMBER

Compare the reference number, amount, date, and sender details.

REJECT BLURRY OR CROPPED SCREENSHOTS

Do not accept screenshots that hide important transaction information.

INSIST ON QR PAYMENT WHEN POSSIBLE

Use QR payment to reduce wrong-number and typo-related errors.

FLAG SUSPICIOUS PAYMENT PATTERNS

Watch out for repeated excuses, rushed messages, edited images, or inconsistent details.

RELEASE ITEM ONLY AFTER CONFIRMED RECEIPT

Give the product or service only when the payment is officially received.

CHAPTER

4

IMPLEMENTATION / RESULTS

ILLUSTRATIVE STUDENT-SELLER INSIGHTS

CHART A: HOW SELLERS VERIFY PAYMENTS

Screenshot only	40%
Transaction history	30%
Reference number	15%
QR confirmation	10%
Other methods	5%

CHART B: MOST COMMON PAYMENT PROBLEMS

Delayed confirmation
Payment was sent, but the seller receives confirmation late.

Wrong number sent
The buyer accidentally sends money to the wrong account.

Edited screenshot
The payment proof is altered or manipulated.

Pending transaction
The transaction is not yet fully completed.

Poor internet or app error
Weak connection or app issues delay confirmation.

CHART C: RISK OF RELEASING ORDERS

HIGH RISK
Screenshot only
The seller may release the item without receiving real payment.

MEDIUM RISK
Screenshot + reference check
Some verification is done, but the payment still needs confirmation.

LOW RISK
Actual received payment
The safest option because the seller confirms the money in their account.

RESULTS SUMMARY

Using a simple verification system can reduce disputes, improve trust, and protect small sellers from unpaid orders.

CHAPTER

5

CONCLUSION

FINAL IMPACT

E-wallets are convenient, but convenience should not replace verification.

By moving from screenshot-based trust to proof-based verification, student entrepreneurs can make digital transactions safer, more professional, and more reliable.

EXPECTED IMPACT

LESS PAYMENT DISPUTES

Fewer conflicts between buyers and sellers.

BETTER CUSTOMER TRUST

Clear payment rules make transactions smoother.

SAFER BUSINESS OPERATIONS

Small sellers can protect their income and avoid unpaid orders.

*Verify first.
Release second.*
